The Egyptian Empire in Asia and Nubia Capital: Thebes					Assyrian invasion	Domination of Persia		Egypt a Roman province

Egypt was a narrow strip of highly productive soil, 8 to 12 miles wide, along the banks of the Nile, about one-fifth of the area of England and Wales. From pre-dynastic times sun-dried mud bricks were used for houses, but these have not survived: timber was scarce and hence arches were built without centering. There was however an abundance of limestone, sandstone and granite. The planning of irrigation canals and fields, necessitated by the annual inundations of the Nile, demanded a system of geometry (Gk land measuring). Believing in a life after death, the Egyptians thought that the body should be preserved in a lasting tomb; this became a geometric construction of great solidity and permanence.

The bent pyramid, Dahshur

Pyramid of Cephren,
Giza

THE GREAT PYRAMID, GIZA

Tomb of King Cheops, Dynasty IV

Built of local stone on a core of rock with casing blocks of Tura limestone. Constructed of some 2,300,000 stone blocks, each weighing approximately $2\frac{1}{2}$ tons. It is probable that for a period of twenty years 100,000 men were levied annually, during the three months' inundation of the Nile (July to October), for transporting stone. Also about 4,000 permanent skilled masons and attendant labourers were employed

WESTERN ASIA

SUMERIAN CITY KINGDOMS

Civilization in Western Asia began with city kingdoms in the rich alluvial plain between the lower Tigris and the Euphrates, an area about that of Wales (Map p. 14). Tower-temples or ziggurats were the centre of city life. There was no stone and little timber but clay was moulded into sun-dried brick. Buildings were faced with kiln-baked bricks, sparingly owing to lack of fuel.

ASSYRIA

Assyria was set on a high tableland of lime-stone, harder rock & alabaster, but the Assyrians continued to use sun-dried and kiln-baked bricks. Palaces of warrior-kings were built on large platforms of brick 30-50 feet high. Lower courses of walls were faced with slabs of alabaster 9-12 feet high and carved with bas-reliefs or covered with plaster and painted with bright colour. The arch was constructed for gateways, vaults and drains.

SECOND BABYLONIAN EMPIRE

Nebuchadnezzar (604-561 B.C.) rebuilt Babylon to a regular plan described in *The Histories* by Herodotus (484-406 B.C.). Buildings were of kiln-baked brick and bitumen.

PERSIAN EMPIRE

Palaces were built at the capital city of Susa, at Pasargadae and Persepolis, being constructed of stone which was abundant in Persia; whilst raised platforms and glazed coloured bricks were adapted from the Assyrians; also influences from Babylon, Syria and Egypt.

SECOND PERSIAN—SASSANID—EMPIRE

The capital city at Ctesiphon. Buildings were erected of kiln-baked brick, vaults and the earliest domes being built over square compartments, developed by the Byzantines.

Stilus, scale and plan of King Gudea of Lagash, c. 2350 B.C.

(reconstructed),

Built by Darius (521-485 B.C.) and Xerxes (485-465 B.C.)

Built on a platform 1500 ft by 1000 ft in area, and 40 ft above

the plain, part solid rock, part large blocks of stone, without mortar,

held by metal cramps. Buildings constructed of sun-dried brick and faced with glazed bricks.

Columns of stone and flat roofs of cedar wood

'Hall of the Hundred Columns'

Assyrian pavilion motifs adopted by the Persians

WESTERN ASIA VAULTS &

Bricks were laid to form a base A; against an end wall B wedge-shaped bricks were fixed with mortar C. To ensure adherence these were often laid in sloping courses D. An arch was constructed with little or no centering to complete the vault E. To facilitate work and to reduce pressure, vaults (and domes) had a high oval profile F. When completed vaults were often re-inforced by a second or more courses of brick G. Sassanid Persian buildings, vaults and domes were constructed of kiln-baked bricks laid with a mortar of lime and sand

The Persians built domes with little or no centering. A dome is an arched construction both vertically & horizontally: each ring of brick or stone once closed in cannot fall if it rests adequately on the ring below

The Persians were the first to erect circular domes on square plans with four angular corbelled semi-domes

	Peloponnesian War	323 <u>Euclid</u> 283		
	429/8 <u>Plato</u> 347			
	384 <u>Aristotle</u> 332			

The Aegean Period. 1 No records survive of the Minoan sea-kings of Crete except remains of palaces, e.g. Cnossus. 2 The Mycenaeans built massive citadels with Cyclopean masonry and domed tholos tombs on the mainland. The Aegean civilization fell before the Homeric Greeks.

The Hellenic Period. The Greeks called themselves Hellenes (Hellas was called Graecia by the Romans). They formed numerous small city states in which primitive houses surrounded a citadel and later a temple built on an acropolis or upper city. National unity was achieved by pan-Hellenic festivals held at Olympia, Delphi, Argos and Corinth every few years.

The Hellenistic Period began with the Empire created by Alexander the Great when many new cities were founded with monumental buildings.

The Greek temple developed from the Mycenaean megaron built of sun-dried brick, stone and timber to house a deity and to be looked at from outside, not to contain a congregation within. The arch was known to the Greeks, but they based their temples on the column & beam. These developed from the 6th-4th centuries B.C., each with its own ratios of proportions established by experience. Columns were often placed closer than necessary to support the entablature in order to create a repetitive rhythm of solids and voids. Optical refinements displaying an appearance of vitality and strength have been measured in a number of them. Many architects wrote treatises about their buildings, cited by Vitruvius (1st cent. B.C.) who classified their plans and proportions.

The Roman Empire

Early Rome, with its Republican magistrates, town-council (senatus) and town-meetings (comitia), by a series of systematic conquests created an Empire round the Mediterranean consisting of different nationalities accepted as allies. The Roman Empire became a fusion of the practical Western idea of one universal society in which all men might live in conformity with Roman law and the Oriental conception of an Emperor-God with a throne-altar demanding a common worship and loyalty. This union between the West and the East was a continual source of weakness and led to the ultimate division of the Empire. The Romans built roads and bridges for swift communication, military camps with a simple set plan (later incorporated in many city-plans) for speed of construction, and government and civic buildings, which were both useful and symbolic of Roman law and order.

INTRODUCTION

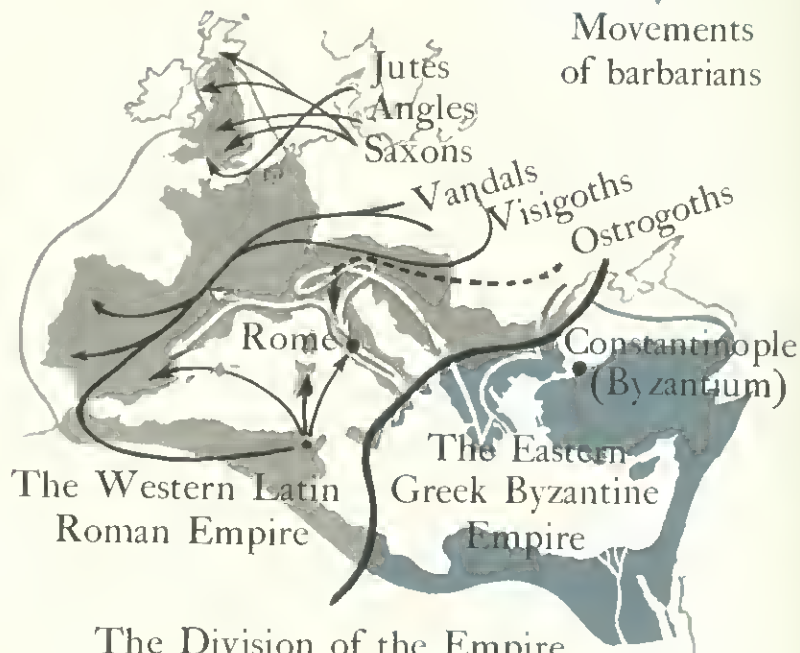

THE ROMAN EMPIRE

Movements of barbarians

27 B.C. — A.D. 324

The Division of the Empire

394 A.D.

During the Republic kiln-baked bricks and stone blocks with or without mortar were used in building. The invention of concrete revolutionised construction in the Empire. Concrete was used with a facing for protection and a surface finish, & there is a sharp distinction between the art of the engineer constructing arches, vaults and domes and the applied art of decoration with columns and pilasters, marbles and mosaics.

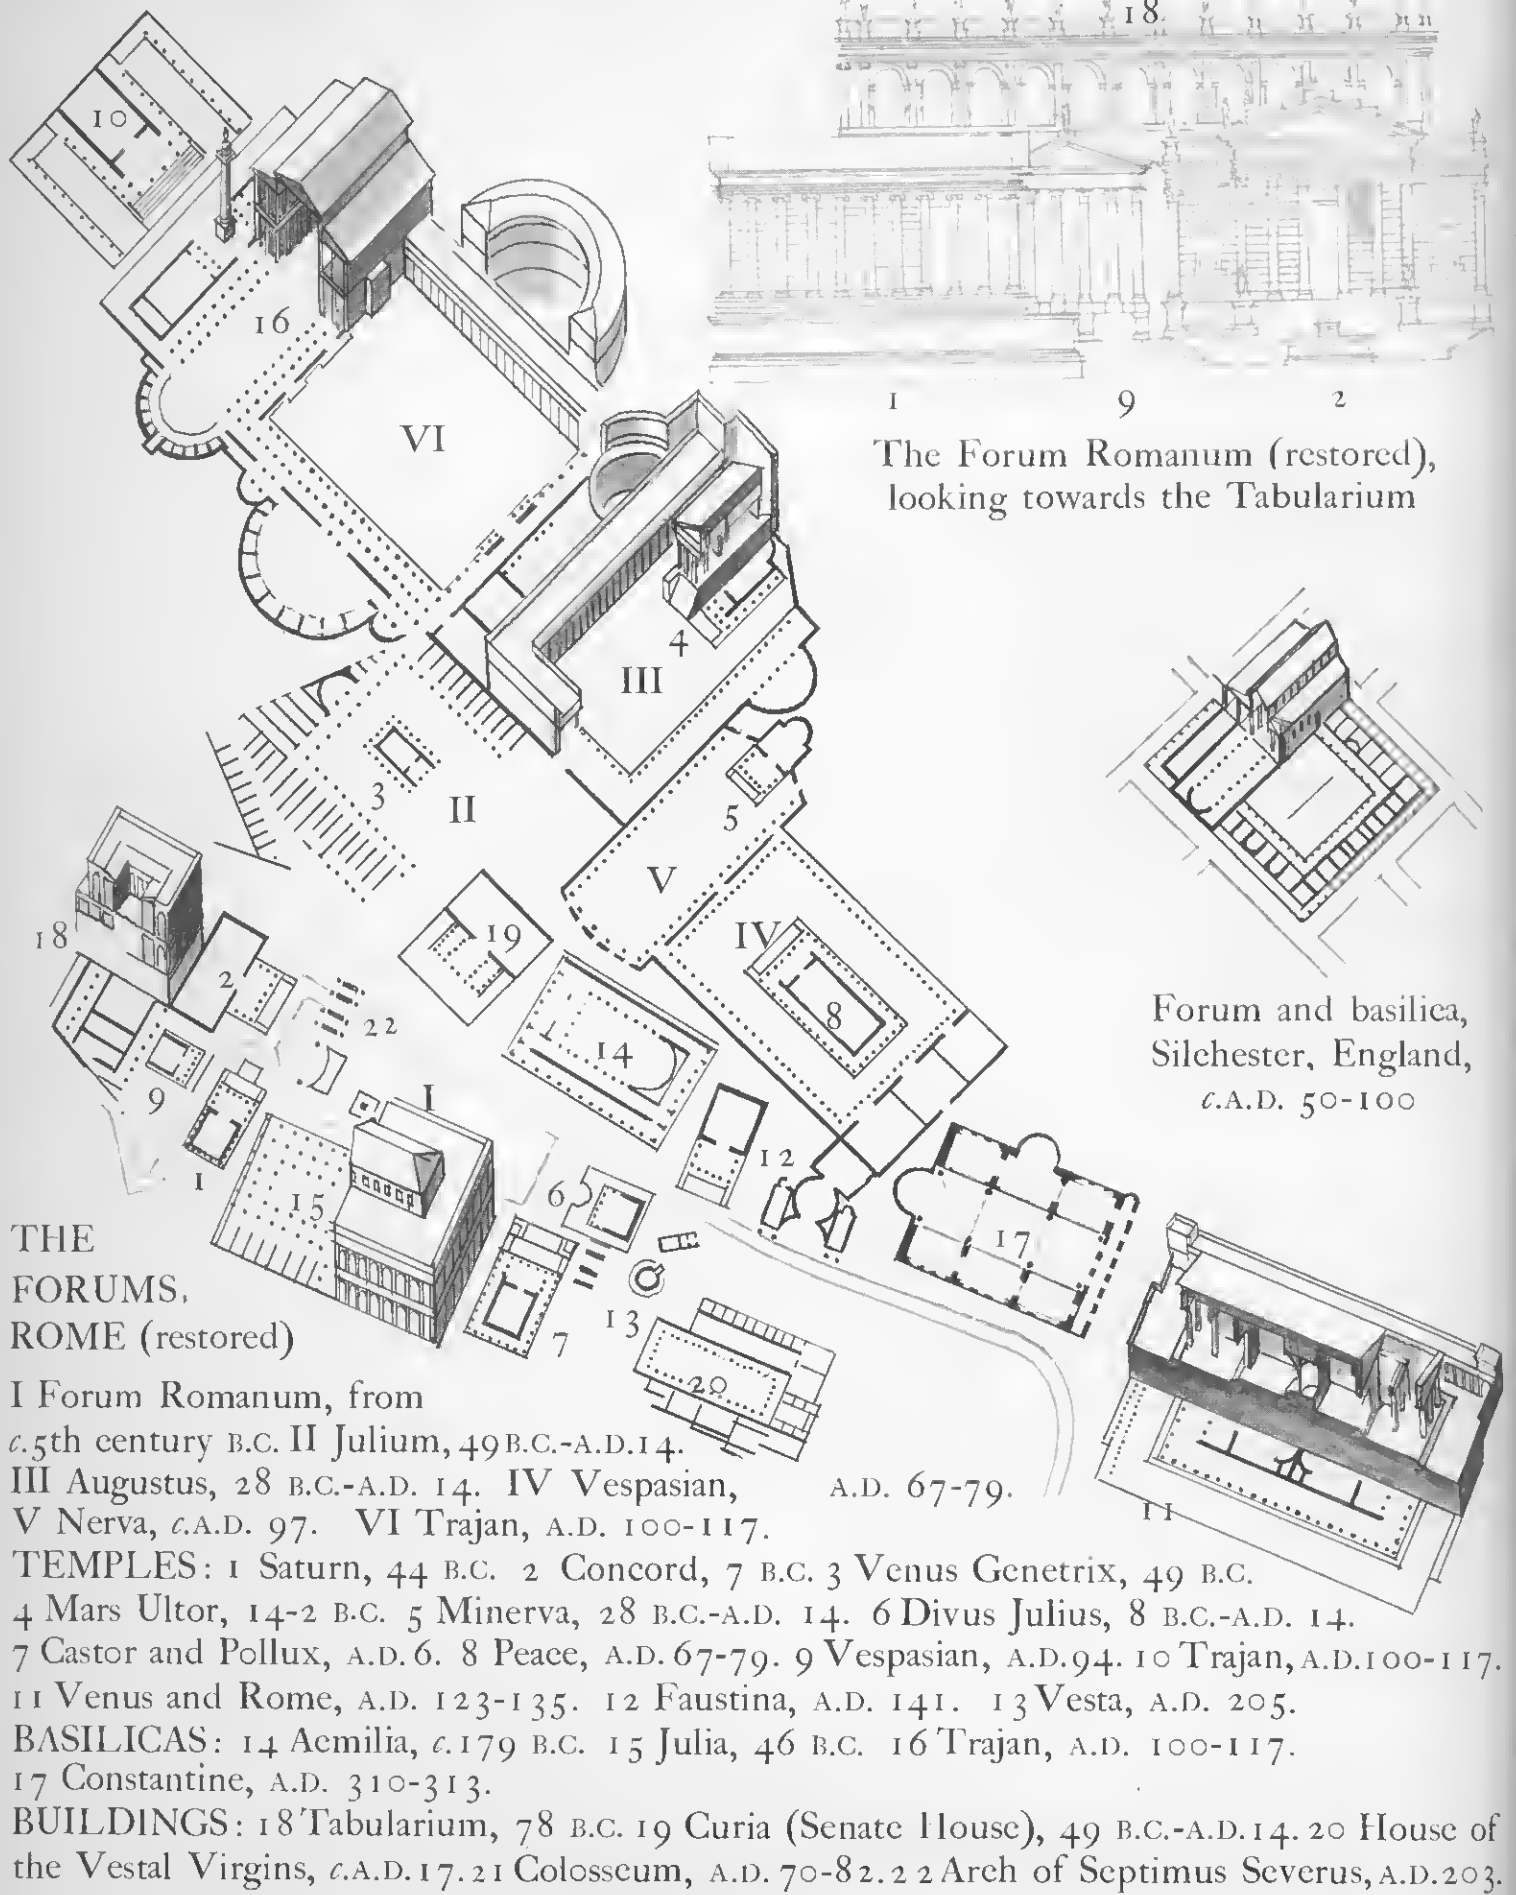

The Romans invented all possible variations in the plans of buildings which were copied by later architects. *The Ten Books on Architecture* by Marcus Vitruvius Pollio, a Roman architect and engineer who lived in the 1st century B.C. was widely read in the Renaissance and later.

CONCRETE

used by the Romans from the 2nd century B.C., consisting of sand, gravel, pebbles, chippings of stone, mixed with a cement of lime and water and spread over a temporary wooden or permanent brick centering, to solidify into the required shape—arch, vault or dome. The dead weight rested upon supporting walls or piers without exerting an outward thrust. Pozzolana, a volcanic rock found near Rome, made a concrete of great hardness and durability.

Concrete surfaces were faced with stucco, brick or marble for protection and finish.

The Temple of Vesta, Tivoli (restored), 27 B.C.-A.D. 14
Foundations: tufa. Podium and walls: concrete.
Columns and door: travertine. Roof: probably a low concrete dome

CIRCULAR & OVAL BUILDINGS

The Colosseum, Rome, A.D. 70-82

Designed for about 45,000 spectators. 80 piers support 3 tiers of arcading. Decorative use of superimposed orders of $\frac{3}{4}$ external Doric, Ionic and Corinthian columns. Foundations: lava. Walls: brick and tufa. Vaults: pumice-stone. Facade: travertine blocks held by metal cramps. Columns and seats: marble

GREEK

THEATRE

Hellenistic

theatre, Priene, Asia Minor (restored), c. 50 B.C.

The early Greek theatre consisted of an auditorium (simply a hill slope with stone seats), a semi-circular orchestra where the chorus sang and danced, and a wooden stage from which a single actor would hold a dialogue with the chorus. The number of actors was raised to two or three by Aeschylus (525-456 B.C.) and Sophocles (495-406 B.C.), who also introduced painted scenery and a dressing hut or skene. In the 4th century B.C. a wooden skene A was erected with a proscenium B having a row of columns, usually Doric, 8-12 ft from the skene wall supporting a stage of planks called the logeion or speaking-place C. Three doors in the skene wall were for entrances and exits of actors. At the two ends of the proscenium were the parodoi or open passage-ways D.

Plan of a Greek theatre based on 3 squares within the orchestra circle (Vitruvius, v.7)

ROMAN

THEATRE

The Theatre, Orange (restored), c.A.D.50. Designed to seat 7000. Stage 5 ft high, 23 ft deep.

Built up on stone and concrete piers.

A Semi-circular cavea or auditorium

B Proscenium replaced by a frons scaenae

C Covered passages—vomitoria
Introduction of a stage curtain

Plan of a Roman theatre based on 4 equilateral triangles in a circle (Vitruvius v,6)

Map of the world, 1527

The enlargement of S. Denis, 1144 (p.89) inaugurated a lyrical form of construction in which pointed arches, high stone vaults and flying buttresses were fused into an organic whole, and which reached a crescendo in the cathedrals built in the Ile de France (pp.100-101). Gothic, or the 'style Ogivale' (Fr.: pointed) was known as 'Opus Modernum' or 'Opus Francigenum' (French work); the term 'Gothic', i.e. barbarian, was first used by the Humanists of the Renaissance. Few plans survive by the lay master-masons, who designed their buildings with 'a good wit of geometry' and who directed the quarry-men, stone-cutters, smiths, carpenters & workmen. In England (pp.102-105), France (pp.106-107), Italy (pp.108-109) and Germany (pp.110-111) castles, parish churches, guild-halls and houses followed the same pattern of pointed arches, pinnacles, spires & high-pitched roofs. South of the Alps in Italy Gothic was neutralised by the Roman tradition and ceased with the advent of the Renaissance in the 15th century.

THE BAROQUE

Baroque

Rococo

1600

three-dimensional elevations and curved details by means of projective geometry, which had been developed by the new science of dynamics.)

This Baroque style was finally resolved into the lighter curves of the Rococo.

1700 1750

The architecture of each European country was a reaction to that of Italy, modified by its own native characteristics.

France (pp.130-133), Germany & Austria (pp.134-135), Spain (pp.136-137), England (pp.138-159).

RENAISSANCE - BAROQUE

(p. 122)

S. Maria della Consolaz-
ione, 1508, *Bramante*
& *Cola di Caprarola*

Pope Julius II (1503-13)
had the old basilican
church pulled down (p. 70),
and successive plans were
made for the new church:

1 *Bramante* (1444-1514)
1506

2 *Raphael* (1483-1520)
1515-20

3 *Sangallo the Younger*
(1485-1546)
1539

4 *Michelangelo* (1474-1564)
1546-64

also designed the dome,
completed 1585-90

by *Giacomo della Porta*
(1541-1604)
and *Domenico Fontana*
(1543-1607);

5 side cupolas added 1564,
by *Vignola* (1507-73)

6 *Carlo Maderna*
(1556-1629) lengthened

nave to form a Latin cross
& added the façade 1606-12

St Peter's, Rome, 1506-1612 (pp. 93, 124)

The Dome of the Invalides, Paris,
1693-1706
(1646-1708) *J. H. Mansart*
(pp. 125, 131)

RENAISSANCE - BAROQUE

Sources of Italian architectural theory:

1. The study of Roman buildings.
2. The Platonic-Aristotelian description of God and the Universe as a perfect circle.
3. The Pythagorean, and Medieval, idea of Man as the microcosm of the Universe (the macrocosm).
4. The linking of Geometry and Music, two of the Seven Liberal Arts:

'Geometry makes visible the musical consonances' (Boethius, *De Musica*, c.500).
In Florence Cosimo de Medici (1389-1462) founded the Platonic Academy.

gives an account of the creation and geometrical form of the universe. He represents the four basic elements and the cosmos as:

these 'Platonic' bodies are the 5 regular solids. The elements of the cosmos, as well as its soul-substance & its motion, were created proportionate to musical ratios based on Pythagoras (582-c.507 B.C.) He 'regarded numbers as the elements of all things and the whole heaven as a numerical scale' (Aristotle), & found that tones could be measured by striking cords proportionate in length.

1:2 octave
2:3 fifth
3:4 fourth

Plato gives the 'Harmonic' scale as:

which contain the musical consonances
1:2, 2:3, 3:4.

For Renaissance architect-theorists, churches based upon these axioms, would be microcosms of the universe of God:
'... the little temples we make ought to resemble this very great one' (Palladio).

Marcus Vitruvius Pollio
The Ten Books on Architecture
Roman architect & engineer 1st century B.C.

Vitruvius
(edited by Fra Giocondo)
Venice, 1511

Ideal plans for churches (VII, 4)

'Of all these numbers...
(1:2 octave, *diapason*;
2:3 fifth, *sesquialtera*;
3:4 fourth, *diatessaron*)
... the architects make very convenient use' (IX, 5)

Ten Books on Architecture

on Architecture*
1537-1575

1475 — Sebastiano Serlio — 1554
Born Bologna. Architect, worked in France

S. Andrea Rome, 1550

1507 — Giacomo Barozzo Da Vignola — 1573

Michelangelo
stated that
a figure should
be made
'pyramidal,
serpent-like
and
multiplied by
one, two
and three',

from
Cesarino's
Vitruvius 1521

St Peter's, Rome, 1506

and wrote in a letter:
'... the architectural
members derive from
human members'.

1475 — Michelangelo — 1564

1508 — Andrea Palladio (pp. 128-9) — 1580

In Baroque churches musical ratios
were resolved into an orchestration of visual
forces comparable to the fugue, & measured
by the eye and the mind of the beholder

S. Andrea al Quirinale, Rome, 1658-70

1598 — Giovanni Lorenzo Bernini — 1680
sculptor and architect

S. Agnese 1653-55 & S. Carlo, Rome 1665-7

1599 — Francesco Borromini — 1667

designs from

*Dell'
Architettura
civile*
Turin 1737

1624 — Guarino Guarini — 1683
mathematician & architect, mostly at Turin

The Italian campaigns of the French Kings, Charles VIII (1483-98), Louis XII (1498-1515) and Francis I (1515-47), failed in their aims; instead France was invaded by the ideas and the arts of the Italian Renaissance.

Italian Baroque churches

Vaults, domes and apses were frequently 'opened out' to heaven by means of *sotto in su* (Italian: 'from below upwards'), illusionist paintings, and often reinforced by three-dimensional figures

Die Wies, Southern Germany, 1745-54
Dominikus Zimmermann (1685-1766)

In Southern Germany and Austria many Jesuit Baroque churches were built in the style of the Gesù (p.122).

The 'Thirty Years' War (1618-48) was followed by a resurgence of church-building in which all the arts—architecture, sculpture, painting and music—were fused into Rococo.

RENAISSANCE - BAROQUE

Sir Christopher Wren (1632-1723).

Early scientific pursuits: optics, hyperbolic lenses & a treatise on cycloids.

Newton in the *Principia* described Wren as 'one of the greatest geometers of our times'.

Professor of Astronomy, London 1657 and Oxford 1661.

First architectural works 1662.
Studied buildings in and around Paris 1665; met F. Mansart, Le Vau, Bernini and probably Guarini.

St Bride, Fleet Street,
1670-84; spire, 1701-3

St Mary-le-Bow,

CAST IRON

is the direct result of smelting iron ore in a blast furnace with coke.

The liquid ore solidifies on cooling & can be given the desired shape by being poured into moulds. The process was first carried out c.1710 by *Benjamin Darby (1677-1717)*. Cast iron is brittle & reacts to bending stress. Used primarily for vertical columns

WROUGHT IRON

is obtained by oxidizing white-hot cast iron. It is puddled (purified) from an excess of carbon & impurities in a 'reverberatory' furnace, introduced by *Henry Cort c.1760s*.

Ductile and malleable, wrought-iron can be pulled out into wire or rolled into beams

STEEL

is made from cast-iron, the carbon being burnt out by a blast of air through the molten metal in a 'Converter',

invented by *Sir Henry Bessemer* in 1856. Steel has equal strength in compression and tension

THE BEAM

& TRUSS

S. / compression or strut
T. \ tension or tie
